

Packing using the AIRBAG principle

Today, every modern car is equipped with airbags, bags of pressurised air to protect the passengers. [®]

The airbag principle can be applied to the packing of objects, too – if we surround them with a “bag of air”. The right packing technique using the airbag principle can be learned from the following pictures and explanations.

Put the object on the paper sheet and wrap it two times, then put the lateral parts over the item and roll it towards the end of the sheet. Now put the paper package on another sheet and wrap it in the same way.

Your item is now safely packed!
